Questions to Ask yourself (throughout the game development process)

- Who is it made for
 - Is it designed for the audience it's made for
- Is it fun
- What's the players motivation/goal
- Is it accessible

Title

-

Concept Statement

What is your concept? Is it a puzzle game in which an alien must find his way home? Or is it a game like Outlast in which the main character needs to find crucial information in an 'abandoned' hospital? This is where you outline what the main idea of the game will be.

-

Genre

-

Mechanics

The game mechanics refer to different aspects of the game. Very simply, they are the visuals, sounds, animations, physics, and more. In specific detail.

-

The Story

Delving deeper, you need to flesh out the descriptions of the story, setting, and who the characters will eventually be. What will your story be? Will it have multiple character arcs, or just one?

-

Characters:

characters all have distinct personalities, and you must do the same for your characters. What are their wants, needs, and motivations?

This is where you fully flesh out our protagonists, antagonists, ancillary characters, and more. This is where your roster of loveable, (or perhaps not so loveable), characters will go to grow and develop into finished products.

-

Setting:

Background: Provide setting of the game, including the world and characters.

-

Target Audience:

-

Levels and Environments:

- Level Design: Discuss the design principles and objectives for different levels or areas.
- Environmental Details: Describe the various environmental elements and their interactive features.
- This can be a real fun one. Break this down into two parts. This is where you outline what world your game will take place in.
- Is it in the real world? New York City? Or is it in your own, unique fantasy world? Building a fantasy or general world may be more labor-intensive on your brain, but it is your chance to really flesh out what world the characters will interact in.
- After creating lore (if you so choose), you need to focus on the actual, physical levels. Will they take place in dusty, abandoned corridors? How about a bright city street? You need to outline where the story's action will take place.

-

User Interface:

This is the display that gamers will use and see during their playtime. These are menus, health bars, advice panels, tutorials, and more. An easy to use user interface will score major points with gamers, trust me.

-

Technical:

These are the aspects of game design like which game engine to use, what programming language to utilize, and more. This is where the coders shine. Will it use JavaScript? C++?

-

Assets:

These are actually the assets used in-game. For example, assets can be specific objects and in-game items such as character models, textures, sound files, etc

-

Project Status Report

Think of this as a regular progress report. You can even add some milestones for you and the team to complete to get an idea or roadmap of the project better.
